

# teleprompt example deck

Presentation basics and media overlays

---

teleprompt

# One simple idea

- Present a standard PDF slide deck.
- Keep the audience focused on the current slide.
- Move forward when you are ready.

# A clear structure

1. Introduce the topic.
2. Develop the main argument.
3. Finish with a memorable conclusion.

# Two useful views

## **Presenter**

Controls the pace and previews what comes next.

## **Audience**

Sees a clean, focused version of the current slide.

# Keep it readable

- Use short headings.
- Prefer a few strong points per slide.
- Leave enough space for every idea to breathe.

## Remember

Slides support the presentation; they are not the presentation.

# Ready to present

Open the PDF, check the display, and begin.

# How a deck declares media

A media overlay is a link around a poster:

```
link("run:clip.mp4?autostart")[image("poster.png")]
```

run: is the convention pdfpc and Impressive already read, so a deck written for them needs no changes. The link rectangle is the overlay region, and the poster is what every other PDF reader shows.

# Animated GIF

The poster is the GIF's own first frame; teleprompt replaces it with the running animation.

`run:media-assets/bouncing.gif?autostart&loop`

# Video

The clip sits beside the document, which keeps the PDF small and the asset editable without rebuilding the deck.

`run:media-assets/clip.mp4?autostart&mute`

# Interactive HTML

The same convention extends to a page: the HTML file's own directory is served to it, so its stylesheet and script resolve exactly as on disk. On the slide it becomes live and clickable.

`run:media-assets/bouncing-balls.html`

# Incremental reveal continuity

Each reveal step repeats the identical link, and teleprompt collapse the repetitions into one overlay — so the video keeps playing rather than restarting as the bullets appear.

- The video starts on the first step.

# Incremental reveal continuity

Each reveal step repeats the identical link, and teleprompt collapses the repetitions into one overlay — so the video keeps playing rather than restarting as the bullets appear.

- The video starts on the first step.
- It does not restart here.

# Incremental reveal continuity

Each reveal step repeats the identical link, and teleprompter collapses the repetitions into one overlay — so the video keeps playing rather than restarting as the bullets appear.

- The video starts on the first step.
- It does not restart here.
- Nor here: one overlay, one session.

# What teleprompt reads

| Written in the deck | What it declares                       |
|---------------------|----------------------------------------|
| run:clip.mp4        | video beside the document              |
| run:spin.gif        | animated image beside the document     |
| run:page.html       | interactive HTML                       |
| ?autostart          | start on commit (also spelt ?autoplay) |
| ?loop               | repeat                                 |
| ?mute               | silence (video)                        |
| ?start=12.5         | seek, in seconds (video)               |

A run: link to anything that is not a media file is never executed and never becomes an overlay.
