

Pulpit

Pulpit is the PDF presenter that does not screw up your projector.

It runs a presenter window on your display and an audience window on the projector, and it treats connection, disconnection, mirroring, swapping, suspend/resume and mixed DPI as the *main* engineering problem — not as polish.

```

```

Status

The presenter is complete and in use: two-window presentation, display reconciliation, layouts, speaker notes, PDF links, presenter annotations, session recovery, and media overlays for animated images and interactive HTML.

Four things are deliberately left undone: the upstream Iced contribution (without which portable targeted fullscreen on Wayland is impossible), physical-hardware qualification, packaging beyond Nix, and screen-reader support — which is blocked on Iced exposing an accessibility tree at all.

Where to go next

- Installation — Nix, other distributions, and PDFium.
- Usage — keys, presenter layouts, and speaker notes.
- Internals — architecture, invariants, the platform boundary, and the display-control findings the design rests on.

Licence

MIT or Apache-2.0. PDFium is BSD-3-Clause and is *not* vendored here.
